

Assignment Client Server and Peer-to-Peer Networking

1. In Client Server architecture, what is the central component?

The Central server is the central component.

2. What are the advantages of Client Server architecture?

The advantages are great performance so there are no worrying about slower devices

you can purchase a single server that is designed to operate at high speeds and

there is one place to go to administer the application. everything is located on the

Central Server.

3. What are the disadvantages of Client Server architecture?

The disadvantages are that you will need a server there are some cost associated with purchasing that hardware and maintaining the software that runs on that and there's some complexity in setting up a large network and having all of these devices and applications communicate back to the central server.
